PHASE 1 – BRAINSTORMING & IDEATION

Auto Ticket Classification Using Flow Designer

Problem Statement

In a ticket management system, support tickets are often classified manually. Manual classification takes more time and may cause incorrect category selection or delayed ticket assignment.

Proposed Solution

Develop an Auto Ticket Classification system using ServiceNow Flow Designer to automatically classify tickets based on predefined conditions and route them to the appropriate support group.

Project Objectives

- Automate ticket classification.
- Reduce manual work for service desk agents.
- Improve ticket routing and assignment.
- Apply conditions and actions using Flow Designer.
- Reduce ticket processing time.
- Provide consistent ticket management.

Target Users

Service desk agents, IT support teams, service managers, system administrators, and authorized users.

Key Features

- Automatic ticket classification.
- Condition-based classification.
- Automatic ticket assignment.
- Flow Designer automation.
- Ticket field updates.
- Priority/category update.
- Notification support.
- Execution tracking.

Expected Outcome

Tickets are automatically classified and routed according to predefined rules, reducing manual effort and improving the efficiency of ticket management.
