PHASE 5 – PROJECT DEVELOPMENT

Auto Ticket Classification Using Flow Designer

Platform Setup

Open the ServiceNow instance and access Flow Designer using the required permissions.

Flow Creation

Create a new flow for automatic ticket classification.

Trigger Configuration

Configure the trigger based on the required ticket event, such as ticket creation or ticket update.

Classification Logic

Add conditions that check ticket information such as:

- Short Description
- Description
- Category
- Subcategory
- Priority
- Other required fields

Actions

Configure actions to:

- Update ticket classification.
- Update category/subcategory.
- Set priority when required.
- Assign the ticket to the appropriate group.
- Send notifications when required.

Flow Testing During Development

Create sample tickets and execute the flow to verify that each condition and action works correctly.

Error Handling

Check missing or unexpected ticket values and ensure that incorrect or unmatched tickets are handled safely.

Development Outcome

A working ServiceNow Flow Designer workflow is created to automatically classify and route tickets according to predefined rules.
