PHASE 6 – PROJECT TESTING

Auto Ticket Classification Using Flow Designer

Testing Objective

To verify that the Auto Ticket Classification system correctly classifies different types of tickets and routes them to the appropriate support group.

Unit Testing

Individual conditions and actions in the Flow Designer are tested separately.

Integration Testing

The interaction between the ticket table, Flow Designer, classification logic, assignment group and notification system is tested.

Functional Testing

Different sample tickets are created and checked to verify whether the correct category and assignment are applied.

Negative Testing

Incomplete, unrelated or unexpected ticket descriptions are tested to ensure the system handles them safely.

Permission Testing

User permissions are tested to ensure that only authorized users can modify or manage the flow.

Performance Testing

The execution time of the flow is checked during normal ticket creation and update operations.

Expected Result

The system should correctly classify valid tickets, update the required fields, assign tickets to the correct group and safely handle unmatched inputs.
