PHASE 7 – PROJECT DOCUMENTATION

Auto Ticket Classification Using Flow Designer

Project Overview

Auto Ticket Classification Using Flow Designer is an automation project designed to reduce manual ticket classification and routing.

Problem and Solution

Manual ticket classification can cause delays and inconsistent routing. The proposed system uses Flow Designer to automatically apply predefined classification rules.

System Requirements

The project requires ServiceNow, Flow Designer, ticket tables, required user roles, a web browser and a stable Internet connection.

Module Description

- **Ticket Creation Module** – Creates and stores service tickets.
- **Flow Trigger Module** – Starts the flow when the required event occurs.
- **Classification Module** – Checks ticket information and identifies the ticket type.
- **Ticket Update Module** – Updates the required ticket fields.
- **Assignment Module** – Routes the ticket to the appropriate support group.
- **Notification Module** – Sends notifications when required.
- **Testing Module** – Tests different ticket conditions and results.

Workflow Documentation

The documentation includes the trigger, conditions, actions, classification rules, assignment process and expected output.

Testing Documentation

Test cases, input tickets, expected results, actual results and test status are recorded.

Screenshots and Evidence

Screenshots can be added for:

- Flow Designer
- Trigger configuration
- Conditions
- Actions
- Sample ticket
- Flow execution
- Final classified ticket

Conclusion

The documentation provides a complete reference for understanding, configuring, testing, maintaining and demonstrating the Auto Ticket Classification system.
